Abstract (en)
The magazine device for labels has at least one magazine (3a,3b) for the labels and a pusher (5) taking the labels to a removal position. This position is sprung in the feed direction and can be moved away against the spring force by a drive device (7). The drive device is reversible. It has a coupling dependent on torque and/or revs, which automatically breaks the drive connection when the drive in the feed direction is taking place. The pusher comes up against the rear of a stack of labels already in the magazine.
