Abstract (en)

[origin: WO9738921A1] The wall or casing is formed from several sheets of metal (5, 6) juxtaposed lengthwise (9, 10) and resting on longitudinal (2, 3) and transversal (4) sections. The longitudinal edges of the metal sheets are shaped as receptacles (13, 14) on which transversal mobile sliding pieces exert pressure, keeping one of the edges (9) pressed against the other (10) and creating laterally rigidifying pressure. The procedure involves the construction of any single wall or space by the attachment of metal sheets (5, 6) by their longitudinal edges (9, 10) to longitudinal sections using opposing transversal thrust exerted locally and at intervals over the entire length of the two adjacent metal sheets (5, 6). This invention concerns the field of metallic construction of walls or closed spaces for use in storage, for example.
