Abstract (en)

A closure (10) for sealing the open end of a specimen collection container (100) from the environment is provided. The closure includes a generally spherical-shaped ball (20) including a passageway (21) extending therethrough. The ball is capable of rotative movement between an open position and a closed position. The passageway of the ball is aligned with the open end of the collection container when the ball is in an open position and is out of alignment with the open end of the collection container when the ball is in a closed position. The closure further includes a socket (40) mountable on an open end of the collection container for accommodating rotative movement of the ball between an open position and a closed position. The closure further includes a spout (140) in fluid alignment with the passageway when the ball is in an open position. <IMAGE>
