Abstract (en)
A covering element (1) for walls has been made which comprises a plate-like body (2) provided with an edge (3) and a lip (4) disposed peripherally. Under relative-engagement conditions between the different covering elements and the adjacent ones, coupling means (6) connects an edge (3) of a panel to a corresponding lip (4) of a panel adjacent thereto, thereby enabling relative displacements between contiguous elements in order to discharge possible mechanical or thermal stresses. <IMAGE>
