Abstract (en)

[origin: EP0908584A2] The parking compartments at least on one outside have a closed outer wall and in the central support structure a transport device is installed, by which vehicles can be moved into the compartments from a starting position and also back to the starting position again. The central support structure (1) comprises several individual, identical portal frames (2) one behind the other, made of roller profiles of high rigidity. The individual frames are firmly clamped in floor foundations (3) and are spaced apart corresponding to the parking compartment width. For formation of the individual compartments (4), right-angled, outwardly extending console supports (6,6') are fixed, the length of which corresponds to the depth of the parking compartment.
