Abstract (en)

[origin: WO9743186A1] The invention concerns a spacer (3, 5, 7, 9) for bridging the spacing between a base surface (11) and a loading surface (2) of a palette (1), the spacer (3, 5, 7, 9) being designed such that it has a guide device (16) perpendicular to the base surface. This spacer can be integrated in conventional palettes and allows retention means which prevent the palette load from slipping to be inserted into the guide device. In addition, the retention means can be rod-shaped, for example, such that a further palette can be placed on the upper end of the retention means. This enables a plurality of palettes to be stacked one on top of the other without the weight of the upper palette resting on the load on the lower palette.
