Abstract (en)
[origin: WO9851895A1] The invention relates to a sliding door, comprising at least one door wing (2, 102, 202, 302, 402). Said door wing is mounted so that it is able to slide between a closed position and an open position on a runner device, by means of a roller element (3, 103, 203, 303, 403a, 403b). It is possible to ensure easy control of the opening and closing movement by arranging the runner device so that it is mobile, and is able to move by pivoting from a tilted position in the closing direction of the door wing (2, 102, 202, 302, 402) to a tilted position in the opening direction of said door wing (2, 102, 202, 302, 402), by means of at least one adjusting drive mechanism.
