Abstract (en)

[origin: WO9744467A1] Compositions and methods are provided for the treatment of conditions associated with mitogen-activated protein kinase cascades. In particular, the mitogen-activated protein kinase p38-2, and polypeptide variants thereof that stimulate phosphorylation and activation of substrates such as ATF2, are provided. The polypeptides may be used, for example, to identify antibodies and other agents that inhibit signal transduction via the p38-2 kinase cascade. The polypeptides and agents may be used in a variety of methods, such as in the reduction of pain sensations.
