Abstract (en)

[origin: EP0914874A2] The glue applicator supply device uses a suction head (2) to take the glue from changeable glue holders. This is achieved by means of an intermediate reservoir (9), which can be filled by the immersion of the suction head in the glue (3). When the suction head is pulled out of the glue, the intermediate reservoir acts as a bridging glue store while the glue holder is being changed. The reservoir may be integrated into the glue space of the container.
