Abstract (en)
An inlet mouth (1) is described for depositing solid refuse (2) inside the container (3) of a unit designed for the collection of rubbish, comprising a casing (4) of quadrilateral section which defines a compartment (13) that is closed at the top by a pivoting lid (5) and opens at the bottom into the said container (3), the inlet mouth (1) being fitted on the outside with means (6, 7, 8, 9, 10) designed to be actuated manually in order to open and close the said pivoting lid (5), and having two pivoting shutters (11, 12) which are hinged on two opposite walls of the said casing (4) and are located between the said compartment (13) and the subjacent container (3), and in that these shutters (11, 12) are mechanically connected to the said pivoting lid (5) such that, when the latter is open, they are adjacent to each other and are horizontally coplanar, separating the compartment (13) off from the subjacent container (3) and, when the lid (5) is closed, they lie next to and parallel with the said two opposite walls of the said casing (4), allowing the compartment (13) to communicate with the abovementioned container (3). <IMAGE>
