Abstract (en)

A description is given of a system (1), for the differentiated collection of household waste, composed of a plurality of adjacent collecting units (2,3,4) each comprising a container (9,10,11) and an entrance port (6,7,8) and each designed to take one particular type of waste, in which system each of the said collecting units (2,3,4) is provided with means (5) for determining the total volume or total number of waste items introduced into it by an individual user, converting these values into algebraic numbers, storing them electronically and transferring them when desired to a memory-containing support which is connected to these means and can sum these values algebraically. <IMAGE>
