Abstract (en)
An apparatus and a method for registering information on photosensitive and thermally developable image material (10) by means of imagewise exposure of the image material and thermal development of the image material around a rotating body of revolution (20) provided with specific heating means (60). In this connection, a temperature variation is measured (68) on the body of revolution in the axial direction (a) and in the tangential direction (t) and the measured temperatures are converted into corresponding control signals (78) for the heating means. <IMAGE>
