Abstract (en)

[origin: EP0689170A2] A value changing mode is set up in the franking machine (12). In a first transaction between the franking machine and data centre (18) contg. the exchange of code numbers a specification value entered into the franking machine is passed to the data centre and stored in specification value memories (28,45) in the franking machine and in the data centre. A recharging mode is then set up. In a second transaction involving an exchange of code numbers between the franking machine and data centre the stored specification values are added to the values stored in a balance memory (26) in the franking machine and a deduction memory (46) in the data centre.
