Abstract (en)
[origin: WO9805821A1] Device for laying railway track. When deploying a long rail in the course of tracklaying, it is desirable that the position of the rail relative to the sleeper be controlled and corrected as required. This is achieved if the roller (1) is free to move relative to the base (7), that is, in practice, relative to either the rail and/or the roadbed. This is achieved by mounting the roller (1) in a cradle (2) which is free to pivot in a base (7), the degree of movement of the roller/cradle relative to the base being limited by twin stops (4). The invention is provided with a carrying handle (6) to facilitate its practical use.
