Abstract (en)

[origin: WO9804789A1] The invention concerns a device (10) for assembling modules (9) modular partitions (1) for separating two adjacent areas (2, 3) of a building. This device (10) comprises first assembly means (28, 31, 34) located on the said first modules, capable of co-operating directly with the second assembly means (29, 32, 37, 38, 39) located on the said second modules, to form between the said modules a mechanical linkage preventing a relative displacement of the two modules transversal to their own plane. The invention also concerns a module for modular partition, assembled with other modules by means of such a device (10), and a method for assembling partition using this device. The invention is applicable in the building sector.
