Abstract (en)

[origin: WO9805873A1] The invention concerns a device for securing two components arranged at an angle with respect to each other, the device comprising a securing angle (12) of which each abutment wall (13 or 14) abuts the respective component (10 or 11) to be connected. The side walls (16, 17) connecting the abutment walls (13, 14) are curved such that nuts or fastening screws no longer project and there is no longer any risk of injury. The securing angle (12) is also blanked off by a cap (35).
