Abstract (en)
[origin: EP0916425A1] The roll correction machine, to correct rolled stock (1), has a run-in for the rolled stock and several bending rolls. It has at least one adjustable running-out roll (5), controlled by a setting element (13), to guide the rolled stock. This roll is fitted after a position sensor device (7) to detect the location of the rolled stock at a predetermined spacing (x1, x2, x3) from the running-out roll. The sensor device is connected to the setting regulator (11) for the running-out roll.
