Abstract (en)
[origin: CA2254096A1] The invention relates to a cutting tooth to be fitted in a cutting-tooth holder of an earthworking appliance having at least one cutter which is mounted ahead of a cutter-support region, as seen in the cutting direction, and has at least one cutting edge, wherein the size of the cross-sectional areas of the cutter-support region which lie perpendicular to the cutting advance direction and intersect the at least one cutting edge remains approximately constant in at least one area which is delimited by in each case two such cross-sectional areas. This allows an efficient cutting advance combined with a simple design even in the event of wear to the advance side facing in the cutting advance direction.
