Abstract (en)
[origin: WO9807123A1] This invention concerns a parking meter (100) with a device (16) for introducing a means of payment, particularly a device for insertion of coins and an indicator (12) for indicating the expiration of a paid parking time. The indicator (12) has at least two optical or acoustic signalling elements (24) for a corresponding number of parking places. An actuating element (22) works with a signalling element with which it is associated, and all signalling elements (24), the actuating element (22), and the device (16) for introducing a means of payment are connected to a common control device (10). The duration of the parking time selected and stored is confirmed acoustically.
