Abstract (en)

A key-change system for a cylinder lock wherein auxiliary tumblers (5) are interposed between upper tumblers (3) and bottom tumblers (4) and removed to enable the key-change, the key means including both a plurality of change keys (8), each having a recess (81) on the back for selectively removing one of the auxiliary tumblers (5), and a key having no such recess (81) on the back, said recesses and the tumbler aligning means of the key means being arranged in said change keys in such a way that use of one of said plurality of change keys and subsequent use of a further change key prevents re-use of said one change key previously used. <IMAGE>
