Abstract (en)
[origin: WO9802363A1] A closure enabling a liquid to be drunk directly from a bottle has a pourer spout (10) movably mounted on a support (8) which rests on the bottle neck (12). The spout and support have respective openings which may be aligned by movement of the spout to enable the liquid to leave the container for drinking. The closure also comprises a cover (2) having a cylindrical skirt (34) and an annular part (38) designed to clamp the edge of the support (8) against the neck of the bottle. The cover also includes a cap (4) which is hinged to it at a hinge zone (6) and is designed to cover the pourer spout (10) when the latter is in its closed position.
