Abstract (en)  
[origin: WO9803422A1] A process and apparatus for conveying pressroom products (1) in a conveyor direction (F) and along a conveyor path (Z) effect transport of the pressroom products (1), which are held in the region of a lateral edge (1a) by a gripper, such that each pressroom product (1) during its conveyance, with the gripper (3) maintaining its holding action, is rotated about a rotational axis (D) which is essentially perpendicular to the lateral edge (1a) being held, which is oriented to the conveyor direction in such a way that the angle between the conveyor direction (F) and a normal (N) running at a right angle to the main surface (2) of the given pressroom product (1) is changed in order to rotate the orientation of the main surface (2) relative to the conveyor direction (F).
