Abstract (en)

[origin: DE19632528A1] This invention concerns a form element with two form panels which are connected by means of spacers (Q) and proposes providing, at least in the spacers (Q), a longitudinal through hole which is sealed off from filler material placed between the panels. In a wall construction with such form elements, stabilising elements, such as straightening rails (RS), can be held and braced by means of connecting elements (G) which pass through the longitudinal holes in the wall. The connecting elements (G) can be easily removed. The form elements are preferably made of separately produced form panels and of spacers (Q) inserted into said panels.
