Abstract (en)
[origin: EP0919506A2] A multi-modular elevator system for a high building comprising at least two cabin modules, means for elevating the cabin modules and means for descending the cabin modules, wherein the system comprises a lower cabin module and at least a first upper cabin module; the cabin modules are rigid bodies which are not collapsible; the cabin modules form a column such that access to the lower cabin module is provided at a lower floor of the building and access to the first upper cabin module being provided on a higher floor of the building; whereby the system comprises accessing means for selectively providing simultaneous access to the lower module and to the first upper module.
