Abstract (en)

[origin: EP0919510A2] The mobile crane (1) has a wheeled chassis (3) supporting an upper carriage (4) with a boom arm (5) and a counterweight which can rotate about a vertical axis, their contours lying within the track width of the rails during movement of the mobile crane along the track. The longitudinal sides and the rear of the upper carriage are shaped to remain within a region defined by two vertical planes on either side of the track during inclination of the carriage when traveling around a cambered track section.
