Abstract (en)  
A unit (1) for automatically loading stockings (2), comprises two pairs of loading profiles (14) which can move between a first process station (15) so that each one receives respective stockings (2), and a second process station (9), in which each loading profile (14) is arranged at a respective pair of fixing profiles (6) which are stationary in the second process station (9) in order to feed the corresponding stockings (2) to the fixing profile (6). A transfer means (17) is associated with the two loading profiles (14) in order to move the loading profiles (14) between the first process station (15) and the second process station (9). The transfer means (17) comprises a carousel (28) which is arranged between the first station (15) and the second station (9), and supports the loading profiles (14). Carousel (28) is mounted so that it can rotate about a vertical rotation axis (17a) in order to rotate the loading profiles (14) about the rotation axis (17a) with a selected transfer angle. <IMAGE>
