Abstract (en)

[origin: EP0919682A1] The control box comprises a housing (1) with a rotary nut (3) connected to a bracket (4) extending in the same direction as the bolts (2a). One face of the housing has a recess (6) containing a component (8) which cooperates with a lug (7) on the bracket to lock it when the nut is rotated into the locked position of the bolts. The bracket is able to move between positions where the lug can be at one end of the recesses or the other, and the locking component comprises a notch in the edge of the recess adjacent to the nut's axis of rotation.
