Abstract (en)  
[origin: WO9836568A1] A method of controlling the viewing of television programmes according to their content involves sending codes using an auxiliary data channel which indicate the level of sexual, violent, distressing, etc. content. These codes are assembled into a wide screen signalling (WSS) signal and detected at a receiver. The receiver is programmed by entering corresponding codes which indicate allowable or forbidden content and cause the display to be blanked and the sound to be muted in dependance on the transmitted codes. A system, programme source and receiver are also described.
