Abstract (en)  
[origin: WO9803406A1] The invention concerns a method of producing a filled, closed, sterilized container which comprises at least one body member and at least one closure part and can be opened without the assistance of tools. The method is characterized in that, when the container has been filled with the appropriate contents, closed in a manner resistant to sterilization and sterilized at temperatures which are sufficient to preserve its contents, the connection between predetermined container parts or container parts defined by this method step is weakened such that these container parts can be separated without the assistance of tools.
