Abstract (en)

A blower device for cleaning dust filters comprises a tank containing pressurised air destined to be sent on to a filtering surface of a dust filter, passing through an obturator (10) which during normal filter operation is closed and which is periodically opened on command to send compressed air on to the filtering surface. A regulation screw (26) operates on the obturator (10) as a limiter, a position of which is adjustable. <IMAGE>
