Abstract (en)

[origin: US6273166B1] The invention pertains to a device for supplying double-sided adhesive tape, drawn from a roll, to a pressure cylinder. To ensure perfect application of the tape onto the pressure cylinder, without overlapping or deflection when two tapes are applied at short distance from each other, the system includes a mounting base into which the roll is inserted axially relative to the pressure cylinder shaft, while the mounting base has a pressure element pushing the double-sided adhesive tape towards the pressure cylinder, and a cutting device axially parallel to the pressure cylinder shaft.
