Abstract (en)

The bracket consists of two L-shaped components (20,30) with smaller ends (21,31) designed to be attached to a support and panel respectively, and longer ends (25,35) which can slide relative to one another to adjust the length of the bracket. The longer ends of the two components are connected by a finger (37) projecting from one engaging with one of a line of holes (26) in the other. The bracket component with the finger has the edges (36) of its longer section folded over inwards to form a slideway for the longer section of the other component, while the latter has elastic tongues (27) to interact with the folded edges.

Abstract (fr)

L'invention concerne une attache de fixation universelle d'un panneau (3) sur un support (2, 6). L'attache est constituée d'un premier et d'un deuxième éléments en L (20, 30) dont les petites branches (21, 31) forment les extrémités de l'attache qui présente une forme générale en S ou en U et dont les grandes branches (25, 35) forment la partie intermédiaire du S ou du U, lesdits éléments étant relativement coulissants par leurs grandes branches pour régler la longueur de l'attache. Application à la fixation de panneaux isolants sur des chevrons ou un mur. <IMAGE>
