Abstract (en)
[origin: EP0924622A2] The bidirectional data communication method uses a pair of microcomputers (1,2), each of which has converters (5,6) that transmit and receive data to and from an optical bus. The data is converted from an asynchronous data stream into a synchronous continuous form. The effective data within a data frame is assigned a specific memory and the number of frames is dependent upon the asynchronous data rate. Independent claims are also provided for a transmission circuit, navigation system comprising above circuit, and a vehicle where the circuit is installed.
