Abstract (en)

[origin: WO9901068A1] The invention relates to a device for the removal of anatomical parts by laparoscopy, comprising a bag (3) to be inserted by means of a tube applicator (21) inside the abdominal cavity. A flexible element (7) is provided along the edge of the mouth of the bag, having such resilient characteristics as to spring back to a loop configuration when it is not subjected to a deformation. According to a preferred embodiment of the invention, such element (7) is formed by a helicoidal spring with a ring clip (10) slidingly coupled thereto, so that the resilient action of the spring keeps the mouth (5) open when the bag (3) is inserted in the abdominal cavity, and by making the clip to slide along the spring it is possible to close again the bag when needed.
