Abstract (en)
[origin: WO9747531A1] This stopper comprises a cylindrical part (1a) to be engaged in the neck (2a) of a container (2) and has a groove (3) which extends peripherally on at least one part of the cylindrical part (1a) circumference. Two channels (4 and 5), separated from each other, extend in the cylindrical part (1a) of the stopper and open into the groove (3) through orifices (4a and 5a) respectively spaced from each other in the groove (3) peripheral direction. A diaphragm (6) in elastomeric material closely matches the shape of the cylindrical part (1a) and the groove (3) surface covering the orifices (4a and 5a) of the two channels (4 and 5). The diaphragm (6) forms a shut-off valve that, by its elastic deformation, allows a fluid substance contained in the container (2) to flow from inside the container outwards, as well as from outside into the said container.
