Abstract (en)

[origin: EP0926432A2] the holder unit has a holder ring (2) on the rear side of the reflector with a pivotable U-shaped holder spring (3). The spring holds the lamp in the holder ring and its arm-connecting bridge is mounted in a bearing cup in a holder ring protrusion facing the reflector. The holder spring is held in the bearing cup by supporting surfaces facing away from the reflector. The holder spring is mounted with the central section of a bulge in its bridge in the bearing cup. The protrusion (8) protrudes radially outwards from the holder ring and beyond the facing sides of holder fittings (13) for the holder ring, which have contact surfaces for the two lateral sections (12) of the bridge.
