Abstract (en)
The proposed terminal is formed with a noticeably prismatic body in the interior of which are provided contact plates double elbowed rising from the walls or vertical faces forming that portion of the prismatic zone. In the other two faces are provided embossings acting as retention elements once introduced the terminal in the interior of the connector's cavity. As is a known form, in the initial portion of the terminal are provided with elbowed surface bases that are narrowed and enlarged provided with the corresponding wings which by a setting operation establish the contact between the terminal and the conductive portion of the conductive wire once naked of its sheath. <IMAGE>
