Abstract (en)  
[origin: WO9809554A1] The invention relates to a back support structure for a seat. The structure has a frame (1) and a deformable support surface (2) comprising a number of strips (3) arranged pivotally with respect to each other at adjacent edges. The support surface can be held in various orientations by vertically extending holding means (5, 6). In order to allow quick and stable adjustment which conforms to a user's back the holding means (5, 6) acts on each one of the plurality of strips (3) individually when engaged. In this way, the seat can be quickly and reliably formed into a shape for supporting the user.
