Abstract (en)

[origin: FR2753357A1] The invention concerns a device for managing stockyards of trolleys provided with coin-operated trolleys. It consists of a device for limiting the number of trolleys stored in a yard so as to avoid congestion. It consists essentially of a double key-receiving groove (22) movable along a predetermined length, rotatably mobile and constantly secured to a key, the length of displacement of the double key receiving groove determining the limit of the file. The displacement of the double key receiving grooves can be done by various means, for instance by sliding along a rail (3). The device is particularly useful for managing stockyards of trolleys of supermarkets, airports, railway stations, etc.
