Abstract (en)

The invention relates to a pressurised container (1) comprising a hollow cylindrical can (2) having a maximum outer diameter (21), the can (2) having an opened end (22) and forming a dome (23) in the opened end (22), a mounting cup (3) crimped onto the opened end (22), the mounting cup (3) comprising a valve (30), a nozzle (4) co-operating with the valve (30) and having catching means (40) engaging with a peripheral groove or ridge (24) provided on the can (2) where the dome (23) merges with the rest of the can (2), and an extra element (5) covering at least partially the nozzle (4) and having a part (50) extending beyond the peripheral groove or ridge (24) in the longitudinal direction (20) opposite to the opened end (22). The container (1) according to the invention is characterised in that the can (2) is provided with a substantially cylindrical section (25) having a reduced diameter (26), the reduced diameter (26) being substantially inferior to the maximum outer diameter (21) of the can (2) and the substantially cylindrical section (25) mating the part (50) extending beyond the peripheral groove or ridge (23) in the longitudinal direction (20) opposite to the opened end (22). <IMAGE>
