Abstract (en)
[origin: EP0928893A2] The electromagnetic valve has a magnetic valve (1) in the form of a 2/2-path magnetic valve open when there is no current. It has a valve rod (11) projecting through a guide shell (12) into a keeper cavity (13) which lies in the diesel oil flow. This cavity is sealed off from the outside by at least one O-ring (16, 17). One end of the rod operates the valve closing body (9) and the other is in active connection with a keeper (18) in the fluid-filled anchor cavity.
