Abstract (en)

[origin: DE19632795A1] The invention relates to a method and device for the lamination of foil strips. Preferably, a copper foil (1) with a conducting structure is laminated on a plastic foil (2). During lamination and before solid bonding the foil strips undergo visual inspection, and tolerance differences with regard to the alignment of the various foil strips are compensated by pulling or pushing. According to the invention, movement of the various foil strips during alignment is facilitated by discontinuous interruptions (4) in at least one of the foil strips or by separation of one of the foil strips.
