Abstract (en)

A wax composition and a method for the manufacture of candles in containers in which from 18 to 24 parts in weight of a paraffin wax are mixed with one part in weight of a microcrystalline wax with a penetration value of at least 60 ddm. The invention makes it possible to increase the productivity of the plant, though providing a product that is completely free from surface defects, is cosmetically superior to that obtained with the conventional waxes and in any case still behaves perfectly during burning. <IMAGE>
