Abstract (en)

[origin: WO9817494A1] A new parallel hybrid electric vehicle design delivers smooth, high power performance while decreasing harmful exhaust emissions and maximizing fuel economy. An electric motor strategically assists the internal combustion engine. This arrangement can increase driveability and make for a very smooth driving vehicle. Decreased emissions are realized by helping the engine to run in a fashion which inherently minimizes emissions. Fuel economy is significantly enhanced by efficiently producing power needed to make the car meet the demands of the driver while leveling the load demands placed on the internal combustion engine. When the internal combustion engine is operating very efficiently under light loading or deceleration, the power source is charged as the motor turns into a generator.
