Abstract (en)

[origin: EP0931589A1] A device for forming and/or coating solid particles comprises a rotating disc (3) inferiorly defining a process chamber and which can assume a rest position in which it inferiorly closes the chamber and a working position in which it affords an annular passage (5) through which a process gas is allowed to enter the chamber. A rotary hydraulic motor (9) commands rotation of the disc (3); two hydraulic linear actuators (12, 13) perform vertical displacements of the disc (3). Both the motor (9) and the actuators (12, 13) are located immediately below the disc (3). The device can especially be used as a granulator or as a coater of granules. <IMAGE>
