Abstract (en)

[origin: EP0933326A1] Parts of the centering mechanism (5) used to control pivot movement of the crane hook (3) are provided to close the mouth (7) of the hook after it has been swung into an engaging position with the load-supporting loop (6). The crane hook can be swung in a vertical plane to engage with the load-supporting loop, the pivot movement being carried out by a centering mechanism also used to fix the hook in a swung-out position or a swung-in position where it is engaged with the loop.
