Abstract (en)

[origin: EP0933530A1] The housing has a suction connection (3.1) and a pressure connection (3.2). The hollow wheel (1) has radial breakthroughs (1.1), which produce a conductive connection between the tooth base and the cover surface of the hollow wheel. In the tooth heads of the hollow wheel and the pinion (2) is a profile groove, in which a sealing component (4) is inserted. The sealing component can slide on the opposing tooth head of the pinion and the hollow wheel. The sealing component is provided with a channel, which produces a conductive connection between the profile groove base and the sealing surface of the sealing component.
