Abstract (en)  
[origin: FR2753791A1] The invention concerns a device dispensing a powdery product, comprising a dispensing channel (20), a reservoir for the product (3) and means for measuring out (4) capable of being actuated manually for loading a dose of product into the measuring chamber (8) before each actuating of the device, said measuring chamber (8) being movable between a loading position, where it communicates with said reservoir (3), and a dispensing position, where it communicates with said dispensing channel (20). The invention is characterised in that said measuring chamber (8) is stressed by resilient means (19) in its loading position, where it is arranged outside said reservoir (3) so as to isolate said reservoir (3) from the environment, said dispensing device comprising sliding cam means (16, 17) integral with said measuring means (14) for displacing said measuring chamber (8) towards its dispensing position after a dose of the product has been loaded, and closing means (5) adapted for isolating said reservoir (3) from the environment when the measuring chamber (8) is not in its loading position.
