Abstract (en)
[origin: DE19652436A1] The invention relates to a centrifuge for measuring haematocrit, designed to receive capillary tubes (27) which are inserted in the rotor (1) and distributed in a star shape around its circumference and whose outer ends, which are facing the outside, rest on the inner rim of the rotor. The interior space of the rotor is formed by separate chambers (14) which are sealed off from each other, whereby each chamber is designed to receive one capillary tube. If a capillary tube breaks, the contents and pieces of the tube cannot enter the neighbouring chambers.
