Abstract (en)
[origin: DE19644787C1] The invention concerns an arrangement for connecting to a telecommunication network in a switching centre, which arrangement comprises an input for receiving signalled data, a device for forming and processing call-controlling data from the data received on the input side, and a device for signalling the processed data at their output. Further provided are a device (DZO A) for converting call-controlling data into neutral parameters using a predetermined parameter list, a device (UMW, MOD) for processing these neutral parameters irrespective of the original format of the call-controlling data, and a device (DZO B) for converting the processed neutral parameters back into call-controlling data using the parameter list in order to transmit these converted-back data after neutral assessment or modification at the output.
